## What's New In LogLady?

What is LogLady? LogLady is a simple tool that you can use to collect and filter Syslog messages for a specific host on your network. LogLady will collect the Syslog messages on any network device that supports Syslog. This includes devices such as print servers, firewalls, routers, computers running Linux and Windows, and others. The good news is that most devices you use support Syslog and they all support multiple protocol formats. Even devices that don't support Syslog will normally pass the information in the correct format. But, if your log device does not support Syslog, you can still use LogLady. It's up to you to send the Syslog messages to LogLady. LogLady can then use standard Syslog parsing programs to convert the messages into human readable messages. LogLady Features: LogLady has these features: Send All Messages to LogLady: Yes LogLady can be configured to log all network traffic to it. If you are using a Windows machine as a Syslog gateway, you can simply configure LogLady to send all messages to it. Then, the messages can be stored locally for reference. Filter the Messages: Yes LogLady can filter the messages so they are not sent to it if they are not formatted correctly. For example, many Syslog implementations only accept a fixed format of "timestamp pid(pid)". LogLady filters out any messages that do not contain the required information. The messages that LogLady lets through can then be sent to you for viewing. Audit the Messages: Yes LogLady can be configured to allow you to view the messages that are being sent. LogLady will then forward the messages to you for viewing. LogLady can be configured to be: notified of any new messages that are received by any host on the network, or turned off completely LogLady logs network traffic to a text file. The text file is named with a timestamp. The timestamp is in the format of YYMMDDThhmmss where YYMMDD is the week in which the event occurred. A lot of other information is logged as well. If the logs are turned on, the message's timestamp is also logged. The name of the text file is defined by the setting "logfile". If the text file exists, it is used and any

messages are appended to it. The format of the message is quite simple. Each line begins with a timestamp in HHMMSS format. The format of each line is also: timestamp For example: 1020104101:12:03:53.952984  
22:40:20:09:39:42:38:49:50:68:54:
